REACTIVE AGENT WORKSPACES

# Ensemble

Your workspace changes. The work goes stale.

Research drifts. Prompts get lost. `AGENTS.md` falls behind.
Keeping research, synthesis, and action in sync becomes another job.

**A directory should remember how to update itself.**

WHO IT HELPS

# A context monorepo for work

- **GTM:** companies, ICP fit, outreach, and follow-up.
- **Research:** repeatable questions with evidence and lineage.
- **Operations:** shared context, recurring inputs, reviewed actions.

These teams already work through coding agents.
Ensemble gives their files **dependencies, freshness, and an approval queue**.

WHAT WE BUILT

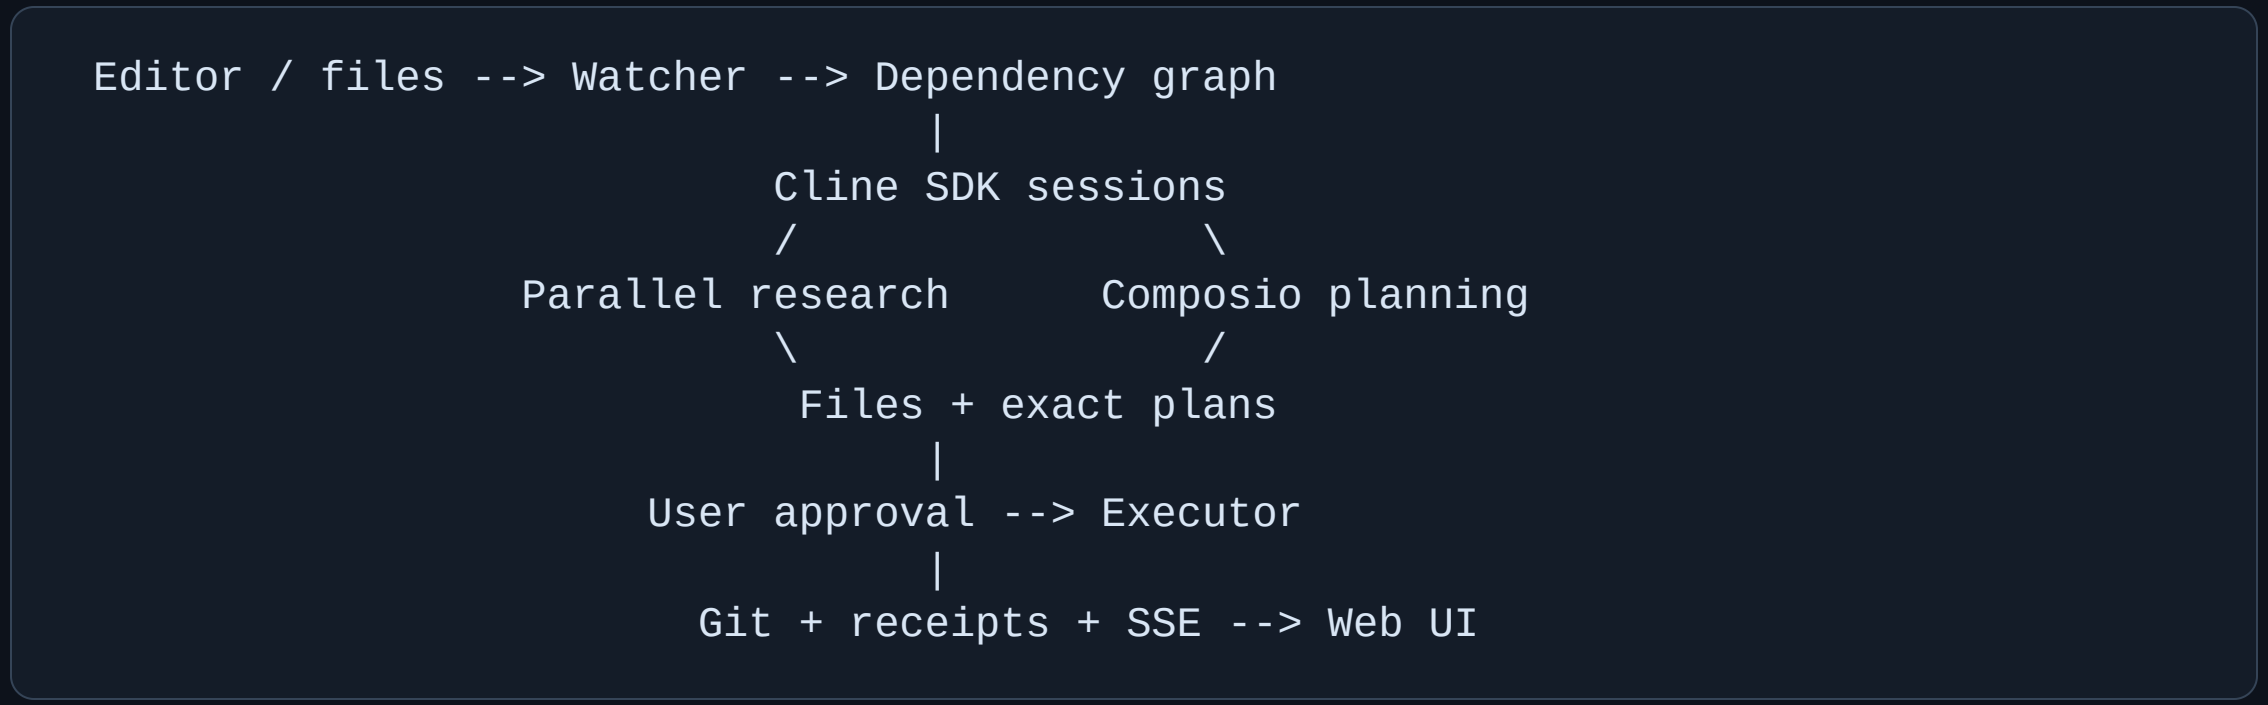
# Prompts become a workflow

- `*.prompt.md` files declare their **inputs and outputs**.
- A reactive graph reruns **stale work in dependency order**.
- Fan-out creates one independent chain per dataset item.
- `*.action.md` files produce **exact plans that wait for approval**.
- A librarian maintains `AGENTS.md`; git records inputs and results.

> The editor stays familiar. The web UI makes the workspace observable.

HOW IT WORKS

# Files in. Reviewed actions out.



Read-only lookups may run while planning. External writes wait for approval of the exact plan.

DEMO + NEXT

# One edit. The right work reruns.

1. Edit ICP context: only downstream synthesis reruns.
2. Add a company row: one new company chain appears.
3. Review full draft bodies and the ticket, then approve the exact plan.
4. Inspect outputs, logs, cost estimates, receipts, and git history.

**Next:** a connected live recording, shared workspaces, event-driven inboxes.

Offline preview uses synthetic research and simulated actions. Live adapters require credentials and linked accounts; real external writes require explicit approval.
